Make your Gallus EM fit for the future

Future-proof again

The Gallus EM series is still one of the most productive printing systems in its class and makes a valuable contribution to the success of many print shops. As a large number of the electronic components installed in it are no longer available, Gallus Classics is now offering a comprehensive retrofit of this press series. This way, we are making these EM presses future-proof again.

Your advantages at a glance

- Future-proof
- Process reliability through state-of-the-art technology
- Option to conclude a service contract
- Reliably available spare parts and components

Gallus EM Retrofit includes*:

- Central control concept (BG09 - main control) with state-of-the-art bus system
- Central motion control
- New main drive system of the latest servo generation
- State-of-the-art HMI operating panel
- Neutral interface ports for external OEM devices with collective error message
- New web transport drive (BG02 - web transport infeed and BG07 - web transport outfeed) with state-of-the-art servo drives, operated via the HMI control panel. For easy handling of the processes.
- Expandable options for on-board slots for further additional applications. This allows the use of existing units such as double rewriter (BG31), laminating unit (BG15) or many other modules to keep them in operation by using new interfaces, in case of discontinuation.

* These measures are standard services which may differ depending on the machine system.
Decisive for the execution is the agreed order.
